## Piscine

What is a piscine?

Much like the selection piscine, the project is split in many small projects (modules), and with each day a new notion on the language/paradigm/technology you chose to work on. Validating a piscine requires more than just a day or two of investment. To ensure that this piscine is done correctly, it is recommended that you take note of everything listed below:

- You can't validate the piscine if you work only on one or two projects.
- Trying to turn in every day: even if something isn't finished, it's better to try and turn it in.
- At least two week of work: going into the piscine shouldn't be taken lightly.
- Each initialized depot will be automatically closed after one day.
- You have two days to complete the required peer-evaluations in each module.
- It is possible to retry your modules without waiting.

It is important not to do these modules alone. For this reason it is highly recommended to approach these piscines with several students.
